CTAD 2017 Statistical workshop: Estimands and primary analyses in AD clinical trials

The primary objective of a clinical trial should be clearly defined with regard to the target of estimation (estimand) for the efficacy of an investigational drug. The fully specified treatment effect of interest should then determine the data collection, data analysis, handling of missing data, and other trial design elements.

Clinical evaluation of 18F-PI-2620, a next generation tau PET agent in subjects with Alzheimer's disease and progressive supranuclear palsy

Intracellular tau deposition is a key pathologic feature of Alzheimer's disease (AD) and other neurodegenerative disorders. Several positron emission tomography tau probes have been developed for in vivo detection of brain tau load, although quantification is challenging due to high off target binding and slow kinetics.
